

Updating the JAVA plugin for Mozilla Firefox

Mozilla Firefox, a browser some use to run CM/ECF, is now disabling some JAVA versions, a plug-in required for CM/ECF.

To fix this issue, all that is needed is a download and install of the latest version of the Java plug-in.

The following directions should allow you to do this.

- 1.) Close CM/ECF and go to www.java.com and click on the red rectangular button that says "Free Java Download".
- 2.) You will be asked to "Save File" - please do so.
- 3.) The file will download and you should see a window that says "Download" with a file icon that looks like a coffee cup. Double-click on this file. (For some, this file may appear on a bar in the lower-left of the browser.)
- 4.) You will be asked to "Run" then asked to "Install" - please do so.
- 5.) A window will appear asking if you want to install the "Ask Toolbar" and make Ask.com your default search engine - you may wish to uncheck this box.
- 6.) Click "Next". The program will install.
- 7.) If your browser remains open during the install, please close and re-open it.

This should resolve the issue that people are experiencing with this plug-in and CM/ECF.
